

I travel by road between 100,000 and 130,000 miles each year. I have traveled, for business, like this for thirteen years. XM Radio has been the best product to be introduced for the traveling public for many years. The ability to actually tune into a program and listen, to the same program, from beginning to end is absolutely marvelous. The standard radio stations target their local market area and do not care about the traveling public, which maybe transiting their coverage area. The ability to obtain current and reliable traffic reports and weather conditions from XM Radio would be very valuable. I would venture to project with this type of information available, traffic congestion due to accidents, weather and construction delays, could be reduced. The possibility of saving lives, also exist, with this type of information available in the winter, when the road conditions change so rapidly. The standard land based stations can not provide the type of programming or coverage that XM provides. Thank You
